

Assume a symmetric monoidal category s.t.

- 1) Every object carries a comonoid $\mathcal{Q}^{(q)}$
- 2) Every morphism is a homomorphism w.r.t. these comonoids
- 3) The comonoids are uniform:

$$\begin{array}{c} \text{X} \quad \text{Y} \quad \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \quad \diagup \quad \diagdown \\ \bullet \\ \diagdown \quad \diagup \\ \text{X} \quad \text{Y} \end{array} = \begin{array}{c} \text{X} \quad \text{Y} \quad \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \quad \diagup \quad \diagdown \\ \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \text{X} \quad \text{Y} \end{array}$$

Lemma

The monoidal unit is terminal.

Proof

Let $f: X \rightarrow I$ be arbitrary, then

$$\begin{array}{c} \text{O} \\ f \\ \diagup \quad \diagdown \\ \text{X} \quad \text{X} \end{array} \stackrel{\text{(unit)}}{=} \begin{array}{c} \text{O} \\ f \circ \text{O} \\ \diagup \quad \diagdown \\ \text{X} \quad \text{X} \end{array} \stackrel{\text{(scalar)}}{=} \begin{array}{c} \text{O} \\ \bullet \\ \diagup \quad \diagdown \\ \text{X} \end{array} \stackrel{\text{(2)}}{=} \begin{array}{c} \bullet \\ \bullet \\ \diagup \quad \diagdown \\ \text{X} \end{array} \quad \square$$

Corollary: $\text{O} = \begin{array}{c} \text{O} \\ \diagup \quad \diagdown \\ \text{X} \quad \text{Y} \end{array}$ Proof. From uniqueness. \square

Define: $\pi_1 := \begin{array}{c} \text{X} \\ \bullet \\ \diagup \quad \diagdown \\ \text{X} \quad \text{Y} \end{array}$, $\pi_2 := \begin{array}{c} \text{Y} \\ \bullet \\ \diagup \quad \diagdown \\ \text{X} \quad \text{Y} \end{array}$ and for $f: C \rightarrow X, g: C \rightarrow Y \langle f, g \rangle := f \circ \begin{array}{c} \text{O} \\ \bullet \\ \diagup \quad \diagdown \\ \text{C} \end{array} g$

Lemma [$X \otimes Y$ is a product]

$\pi_1 \circ \langle f, g \rangle = f$, $\pi_2 \circ \langle f, g \rangle = g$, and is the unique such morphism.

Proof

$\pi_1 \langle f, g \rangle = \begin{array}{c} \text{X} \\ \bullet \\ \diagup \quad \diagdown \\ \text{C} \end{array} \circ \begin{array}{c} \text{O} \\ \bullet \\ \diagup \quad \diagdown \\ \text{C} \end{array} g \stackrel{\text{(2)}}{=} \begin{array}{c} \text{X} \\ f \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} \stackrel{\text{(unit)}}{=} \begin{array}{c} \text{X} \\ \bullet \\ \diagup \quad \diagdown \\ \text{C} \end{array} f$, and symmetrically for $\pi_2 \langle f, g \rangle = g$.

Now assume $\begin{array}{c} \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \\ h \\ \diagup \quad \diagdown \\ \text{C} \end{array}$ s.t. $\begin{array}{c} \text{X} \\ h \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} = \begin{array}{c} \text{X} \\ f \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array}$ and $\begin{array}{c} \text{Y} \\ h \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} = \begin{array}{c} \text{Y} \\ g \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array}$. Then:

$$\begin{array}{c} \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \\ h \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} \stackrel{\text{(unit)}}{=} \begin{array}{c} \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \\ h \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} \stackrel{\text{(3)}}{=} \begin{array}{c} \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \\ \bullet \\ \diagup \quad \diagdown \\ \text{C} \end{array} \stackrel{\text{(2)}}{=} \begin{array}{c} \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \\ h \circ \text{O} \quad h \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} \stackrel{\text{(ass)}}{=} \begin{array}{c} \text{X} \quad \text{Y} \\ \diagup \quad \diagdown \\ f \circ \text{O} \quad g \circ \text{O} \\ \diagup \quad \diagdown \\ \text{C} \end{array} \stackrel{\text{(det)}}{=} \langle f, g \rangle \quad \square$$
